

I am an **AI Engineer** with a strong background in designing, building, and operationalizing AI systems that deliver measurable business value. My experience covers the full lifecycle of AI solutions, from translating business objectives into technical strategies to hands-on implementation, deployment, and long-term operation in production environments.

I have **recently finalized my role as an AI Engineer at Hekanize**, where I work across the full AI stack while also taking on broader leadership responsibilities. In this position, I defined and executed the AI roadmap for a SaaS CRM product and led the delivery of production-grade AI systems centered around Large Language Models, generative AI, and automation. Alongside leading the AI team, I acted as the **primary DevOps owner**, designing and maintaining cloud infrastructure, CI/CD pipelines, containerized environments, and infrastructure-as-code to ensure reliable, scalable, and cost-efficient deployments.

Due to the scope of the role, I operated beyond pure engineering execution. I worked closely with **clients, business and sales teams, internal engineers, and external software suppliers**, translating requirements into technical solutions and coordinating delivery across stakeholders. I value roles where **communication, collaboration, and strong soft skills** are essential, and where close interaction with people is part of the day-to-day work.

From a technical perspective, my work includes Retrieval-Augmented Generation pipelines, semantic and hybrid search systems, multi-agent workflows, and the integration of commercial and open-source LLM APIs into scalable architectures. I remain deeply hands-on, developing Python-based AI components, training and fine-tuning models, designing evaluation and monitoring strategies, and managing end-to-end delivery through modern MLOps and DevOps practices.

In addition to applied generative AI, I have a strong **Computer Vision background** from my Master's and PhD studies. My experience includes **facial emotion recognition, YOLO-based person detection**, and **human activity recognition**, combining deep learning with real-world deployment constraints.

I am motivated by roles where AI is applied to real business problems, where ownership is expected, and where I can contribute across engineering, operations, and solution design while working closely with people. I bring strong technical depth, delivery focus, and leadership experience, with a clear emphasis on building reliable, impactful AI systems aligned with business goals.
